

Mountain Futures conference

Nurturing seeds for change in the Anthropocene

1 to 4 March 2016 – Kunming, China

Call for 'seeds'

The term Anthropocene recognizes that humans have become the dominant agents of environmental change. In keeping with the tendency to focus on the negative effects of human activities, the Anthropocene is generally viewed as an epoch of environmental destruction and degradation as consequences of human meddling. This view should not blind us to the positive potential of human transformations.

Discussion of the Anthropocene has so far been more global than local. The role of specific environments including mountains has not often been considered, nor has there been adequate dialogue on regional and local environmental and social implications. This inhibits our ability to think of positive opportunities for mountains and the people who live in them.

There are persuasive reasons for taking a special look at mountains in the Anthropocene. The highlands are home to twelve percent of the world's population and half the global biodiversity hotspots. They are the sources of vital waters and important crops. They provide refuge for endangered species and cultures. They are hotspots of global environmental change, with adverse but also potential positive consequences. Mountains are areas of environmental and cultural diversity; they may serve as repositories of global learning and testing grounds for adaptations to global change.

This conference invites anyone with an interest in the mountains to register their 'seeds of change': grass-root practices and ideas that show the positive potential of human activity in the environment. Together we will nurture these seeds to seedlings and eventually to robust trees.

Themes

Global Assessment of Climate Change

Highlands are the sources of water for drinking, crops, energy and more. They are, however, susceptible to climate change: glaciers and permafrost are melting, plants and animals are shifting, treelines and ecosystems are changing and natural resources are being exploited for local economies and industries. Natural disasters are increasing and intensifying. A global assessment of how climate change has impacted and will impact mountains in the future needs to be explored by collecting cases of positive adaptations to the Anthropocene from across the mountainous regions in Asia and rest of the world. The human face behind these practices needs to be revealed.

Mainstreaming the Marginalized

Mountains are home to a tremendous variety: in knowledge, language, belief systems, settlement patterns, livelihoods and land use practices. Yet, people's traditional ways of coping with environmental conditions are proving inadequate in the face of intensifying environmental and social change. In the Anthropocene, intercultural communication will become more important with people playing key roles in environmental protection and social and economic development. How can we reduce barriers for the disadvantaged: women (and men), ethnic minorities, the elderly, children?

Dynamic Sustainability

Whether positive or negative, anthropogenic drivers dominate today's mountain regions. But how do culturally diverse mountain people adapt? What are the important natural and social patterns for climate, water, goods, energy, settlement, livelihoods and land use? Defeatist visions about the future of mountains forecast increasing risks, poverty and degradation. But they shroud the opportunities and inspiration that compel people to take adaptive action. We want to explore alternatives that will make a positive difference in local livelihoods. Combining scientific research and civic knowledge to develop a hybrid and dynamic methodology can ensure long-term sustainability.

Water Governance

Climate change is destabilizing upstream water supplies and increasing downstream water demands are causing conflicts. Water is increasingly becoming a political resource triggering transboundary conflicts and governance issues. Instead of sharing water, sharing benefits from socioeconomic development alongside efficient and effective participation and access to open information need to build a foundation for good water governance.

Impact

The Conference aims to explore and assess the role of mountains in the Anthropocene, and to develop plausible visions for mountains in a future where unintended or unforeseen consequences of human activities may dominate natural processes. We want to solicit, explore and develop **visions of mountain futures that are socially and ecologically desirable, just, and sustainable** in a human-dominated Anthropocene.

We want to build awareness of impacts of global change on mountains. By collecting seeds of “Good Anthropocene” practices from montane communities, assessing policy and institutional barriers, and considering the anthropogenic impacts of global change on local communities, we want to **share knowledge** that leads to future solutions. We want to **facilitate dialogue** on adaptation to global change among multiple montane stakeholders. Disasters are on the rise and the livelihoods

of the people living with them are at risk. We intend to **bridge the gap** between scientific research and development on ground. In the post MDGs scenario and the recent progress on the SDGs we want to stress on the importance of mountains and the people living in them. Finally, we want to produce **partnerships for regional cooperation** in adaptation, water governance, and risk management in mountain regions.

**Meet.
Grow.
Present.
Get noticed.
Share.**

Why attend?

Meet. Get an opportunity to meet over 200 participants from all over the world, including researchers, stakeholders and globally renowned experts on mountain environments.

Grow. Bring your ‘seeds of change’ for a good Anthropocene to the conference and bring them to fruition.

Present. Keynote speakers and a number of selected scientists and practitioners will have the chance to present and discuss their work.

Early-career scientists: Get noticed! We strongly encourage creative presentations (such as, but not limited to, documentaries). The best will be allowed to present.

Share. Whether you’re a young scientist or an expert, all conference proceedings and scientific papers will be made public via journals, ebook etc.

Practical info

For whom

We welcome scientists and stakeholders from all over the world with an interest in mountains. Young scientists in particular are encouraged to participate and present their work in a creative way, such as but not limited to, visual art and documentaries. Travel and lodging expenses will be covered for selected keynote speakers. Other requests for financial support must be made via a specific form available on the website.

Deadlines

Individual seeds can be registered on www.mountainfutures.org until 31 DEC 2015.
We call for special sessions along the four conference themes until 30 NOV 2015.
Participation confirmation: 31 OCT 2015–31 JAN 2016

When & where

The conference will be held from 1–4 March 2016 in Kunming, the capital of China's mountainous Yunnan province. Participants should ensure that they are eligible for a Chinese visa and apply in time. Invitations from the Chinese Academy of Sciences can be arranged if necessary.

Confirmation

To confirm your attendance or for any questions, please contact Sander Van de Moortel at s.vandemoortel@cgiar.org, or register at <http://mountainfutures.org/signup/>
